1	Kingdon & Scurran (2016), Artificial Intelligence Adoption by SMEs to Achieve Sustainable Business Performance	TEC	Core Technical Advantage, Complexity, Compatibility	Leadership, Human Capital	Market/Resource Demand, government support	First Use	AI Adoption	Customer Satisfaction, Operational Performance	AI adoption	TEC dimensions significantly affect AI adoption.	Explains challenges, compatibility, sustainable human capital, market/customer demand and government support were significant.	Need to identify factors influencing SME AI adoption and sustainable performance.	Interviews (about control and generalisation)					Abstract, conceptual model, hypotheses, results	"Factors: challenge, compatibility, sustainable human capital, market and customer demand, and government support"	https://doi.org/10.1080/17513758.2016.1191184	Verified empirical
2	Leah, Ochieng et al. (2023), Determining Factors Related to AI Adoption Among Manufacturers in SMEs	Not specified as a named framework in this paper	Not specified	Top management commitment, employee readiness, organisational readiness	Competitive Pressure (CP), External Support (ES)	None identified		Artificial Intelligence Adoption (AIAs)	AI adoption	DAC and CS significantly affected AI adoption; CP, ES, and CS were insignificant.	DAC and CS significantly related to AI adoption; CP, ES, and CS had insignificant effect.	Need empirical evidence about AI adoption determinants among SMEs.	Survey (CS, 100)	SmartPLS 4	156 SME owners/managers	Malaysia	Care	Abstract, hypotheses, results	"Competitive Pressure (CP), Top Management Commitment (TMC), Employee Readiness (ER), External Support (ES), Organizational Readiness (OR)"	https://doi.org/10.3389/fpsyg.2023.1081818	Verified empirical
3	Salimien, Kurni, et al. (2024), Organisational Readiness and Intentions Toward AI Adoption: Evidence from Bangladesh	TEC + CSR	Technological Compatibility (TC), Perceived Compatibility (PC), Feasibility (FI), Technology Adapt (TA)	Organisational Readiness (OR), Digital Literacy (DL)	Government Incentives/Support (GIRS)	None identified	Technology Adapt (TA)	AI Adoption Intention (AIAs)	Readiness – AI adoption intention	Direct Bangladesh evidence on readiness and adoption intention.	CS, TC and FI significantly affect adoption intention; PC and FI significantly affect Technology Adapt, which significantly affects AI adoption intention. Government Incentives were not significant.	Need Bangladesh-specific evidence linking readiness to intention.	Sample size 367, cross-sectional design, Bangladesh-only context	SmartPLS 4.2 / PLS-SEM	57 valid responses, verified sampling	Bangladesh	Very Low	Abstract, readiness model, results	Integrating the TEC framework with the CSR theory	https://doi.org/10.3389/fpsyg.2024.1241111	Verified empirical
4	Sharma, Singh, Vohra & Siro (2023), Why Do SMEs Adopt or Reject Chatbots?	TEC	Perceived Relative Advantage, Perceived Compatibility, Perceived Cost	Top Management Support, Perceived Compatibility, Perceived Relative Advantage	Perceived Vendor Support, Perceived Competitive Pressure, Perceived Resource Availability	None identified	None identified	AI Chatbot Implementation Intention	Adoption intention	Six of nine factors significantly affected AI chatbot adoption intention.	Relative advantage, employee capability, financial resources, and top management support were positively correlated with adoption intention. Complexity and cost were negatively correlated. Vendor support, competitive pressure, and customer pressure were insignificant.	Limited empirical research on SMEs' AI adoption, particularly on chatbots and SMEs in developing countries.	Survey-based study, Pakistan-based sampling, may not represent all SMEs, cross-sectional, future research should examine larger businesses.	SmartPLS 4.2 / PLS-SEM	203 SME respondents	FG	Care	Abstract, RQs, TEC framework, conceptual model, results, limitations	perceived employee capability, perceived availability of financial support, perceived top management support, perceived cost, perceived complexity and perceived relative advantage	https://doi.org/10.1080/17513758.2023.2241111	Verified empirical
5	Priyadity, Chakrabarty et al. (2024), When Determines AI Adoption in Companies? Mixed Method Evidence	TEC	AI Compatibility, Perceived Benefits	Role Clarity, Perceived Trust	Data Governance, Data Quality	AI Ethics in the innovation firm size is not a moderator	AI Adoption Readiness	Competitive Advantage	AI Adoption Readiness	AI Compatibility, Perceived Trust, Data Governance, and Data Quality significantly affect AI Readiness. AI Readiness partially mediates the relationship between AI TEC factors and Competitive Advantage.	AI Compatibility significantly affects AI Readiness, while Perceived Benefits does not. Perceived Trust significantly affects AI Readiness, while Data Clarity does not. Both Data Governance and Data Quality significantly affect AI Readiness. AI Compatibility, Role Clarity, Perceived Trust, Data Governance, and Data Quality significantly affect Competitive Advantage, while Perceived Benefits does not. AI Readiness also significantly affects Competitive Advantage.	Insufficient evidence on AI adoption in SMEs in India, and limited understanding of the firm size, organisational, and environmental factors influencing AI adoption and its competitive outcomes.	Sampling may not capture the heterogeneity of Indian SMEs, Online survey may introduce response bias, SMEs may have biases such as cultural factors, trust, and data quality. The study examines manager' perceptions rather than actual AI implementation/adoption.	Mixed method, Qualitative interviews with selected qualitative analysis, followed by quantitative based SEM using AMOS, mediation analysis, and moderation using PROCESS Analysis.	MSB manager-level responses from 3400s	India	Care	Abstract, RQs, TEC framework, hypothesis development, qualitative analysis, Figure 1, quantitative results, limitations	"Technological factors (perceived compatibility and perceived benefits), organisational factors (role clarity and perceived trust) and environmental factors (data governance and data quality)"	https://doi.org/10.1080/17513758.2024.2341111	Verified empirical
6	Berheci, Maitav et al. (2021), AI as AI Adoption Model for SMEs	AI Maturity and Adoption Model	Digital and Smart Factory, Lean Strategy	Human Resources, Organizational Structure, Organization Culture	None explicitly	None	None	AI Readiness / AI Adoption	AI comparison, 50 SMEs + 3 large enterprises	Europe	Manufacturing/Industrial	Questionnaire survey	Initially testing 10-200 per other manufacturing companies	Conceptual framework with pilot empirical application	SMEs need a practical, accessible model to assess AI readiness and identify organizational areas requiring improvement	Can, not TEQ			https://doi.org/10.1080/17513758.2021.2041111
